

# SAFETY IN SCHOOLS: ALARM SYSTEMS IN THE EVENT OF AN ATTACK

Unfortunately, school shootings, attacks on public authorities and other public institutions do happen. The intelligent safety technology developed by ATT AG enables swift communication in the event of an acute dangerous situation and allows protective measures to be initiated as quickly as possible. An alarm can be triggered in various ways in order to warn all of the affected people within a building.

## TYPES OF ALARMS

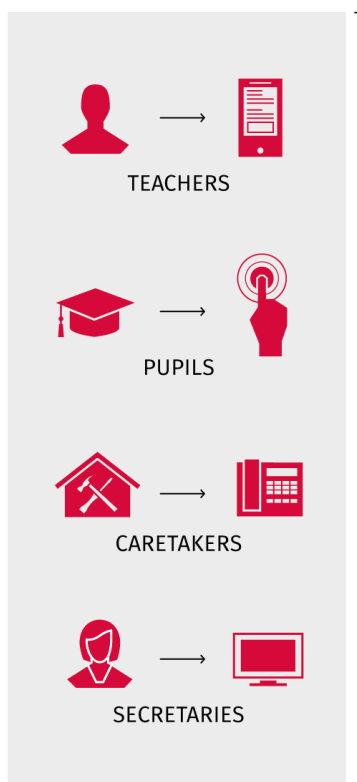

In the event of an attack, teachers, pupils or principals must be able to trigger a (silent) alarm quickly without being noticed. This can be done via telephone, text message, ATT APP, PC or an emergency button. The alarm can be transmitted to any smartphone.

It is also possible to convey the alarm triggering person and locate the source of the emergency call via text message. The ATT Alarm-APP makes it possible to inform pupils in a matter of seconds.

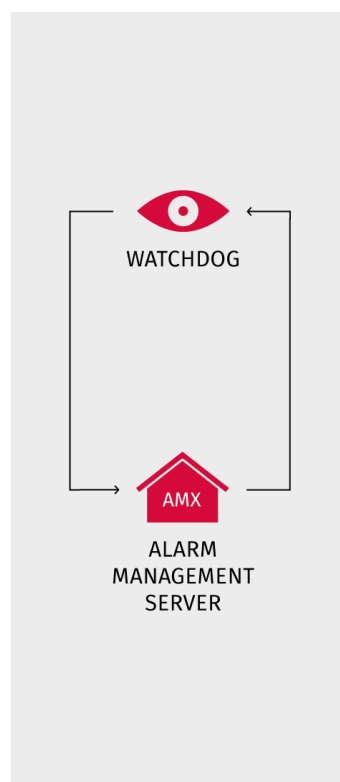

## INDIVIDUALLY CONFIGURABLE

ATT's intelligent safety technology can be configured specifically depending on the available infrastructure. Existing telephone systems and loudspeaker systems can be utilised as well.
