

FIRE ALARM

In order action can be taken quickly in an emergency situation, fire alarm systems are required by law in Switzerland for a number of institutions. Industrial and commercial buildings, hospitals, care homes, hotels, schools, theatres, large office buildings and many more require certified fire alarm systems. Equally indispensable is an excellent alarm solution that not only will prevent fire damage, but also expensive false alarms.

INFORMING INTERNAL COMPANY FIRE BRIGADE AUTOMATICALLY

False alarms are triggered for a variety of reasons, however can be reduced by using the ATT AG alarm solution. Predefined employees of a particular institution, can be informed via the ATT Alarm-App, text message or PC in the event of a triggered alarm. Location details of the triggered alarm are being sent as well. The employee receiving the alarm can then personally assess the situation and distinguish between false or true alarm to prevent the fire services from responding to the call.

FIRE CONTROL

The internal fire department is automatically informed in the event of a fire. Certain functions are activated autonomously by the fire control system – for example, fire doors are closed to seal off the source of a fire, ventilation systems are switched off and smoke and heat outlets are opened.

Depending on the UCC infrastructure, fire alarms can furthermore be given higher priority (separate busy participants, bypass call forwarding, open loudspeakers automatically etc.) The fire alarm system is monitored at all times and the Technology Group is informed immediately in the event of an incident.
